

# PermaSense

Achievements, current status and  
further work

Igor Talzi and Christian Tschudin, University of Basel  
slides for the MICS-TinyNode Development Coordination  
meeting, EPFL Lausanne, Sep 27, 2006

# PermaSense stands for...

- Building and customizing a set of wireless measurement units for use in remote areas with harsh environmental monitoring conditions
- Gathering of environmental data that helps to understand the processes that connect climate change and rock fall in permafrost areas

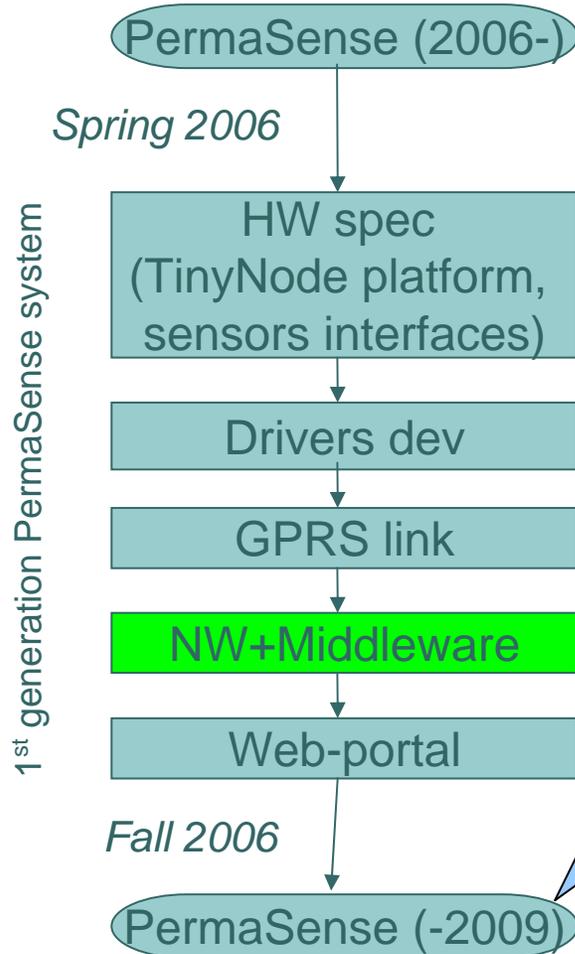

# Project Partners

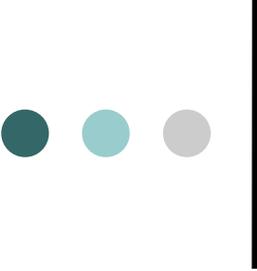

**Since Feb 2006: Getting started, getting connected ...**

# Current state, research areas

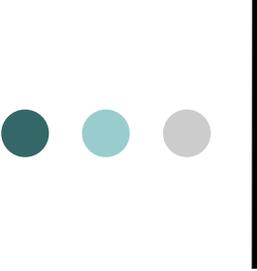

1. **Multi-hop routing, redundant GPRS gateways**
2. Mobile code for config and ad hoc queries
3. **Robust data collection, in-network replication**
4. In-network (seismic) data compression

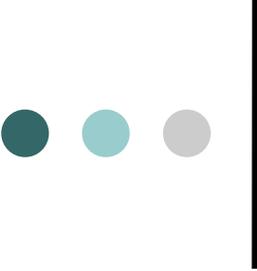

# Quick snapshot

- Low-level SW side:
  - TD-like MAC based on Skew Balance Time Sync Protocol for ICNs (long-term stability, fine tuning via commands injection, post-calibration)
  - permanent flash storage (flash + **SD**)
  - sensors support, unique sensor id
  - GPRS gateway (bridge, conf, time sync); multi sink
  - FEC scheme (DECTED)
  - data flow + enhanced FEC (BCH codes) + end-to-end ARQ
  - multi-hop routing (deep integration with the MAC-layer)
  - small changes to OS: T2-like time subsystem, network types

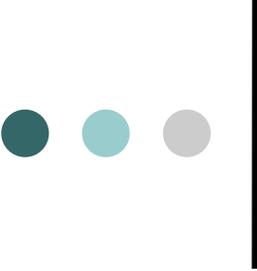

# Quick snapshot (cont.)

- High-level SW side:
  - terminal monitoring program
  - data sink front-end software (database, web interface, conf utilities)

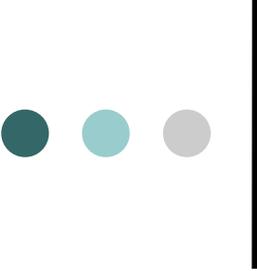

# Quick snapshot (cont.)

- HW side:
  - new mother boards
  - sensor rods
  - enclosures
  - protective shoes
  - other electrical stuff

# Ongoing activities and further steps

- First PermaSense deployment is doing right now in Jungfrau
- System hardening coz nobody repealed Murphy's laws
- Second deployment site in France (autumn-winter 2006)
- “Born stupid? Try again.” - second generation (next summer)

The end

Thank for your  
attention
